

2024 Brave Sensors: Library Impact Report

Brave makes overdose detection tools that activate life-saving community response.

Brave Sensors detect potential overdoses and instantly alert on-site personnel.

Total Sensor Impact 2024

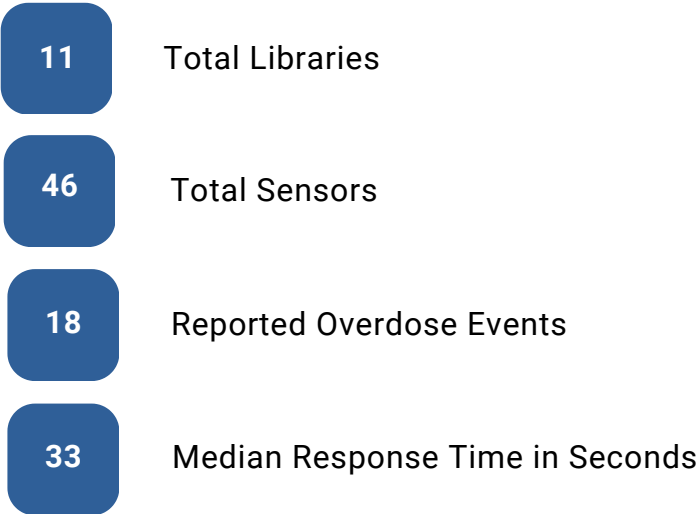

Not all overdoses result in death: While **214 overdoses** were averted through timely interventions using Brave’s sensors in 2024, not all of these would have resulted in fatalities. Some individuals might have been found and treated by other means, albeit with delays, such as by emergency services or other personnel in the area.

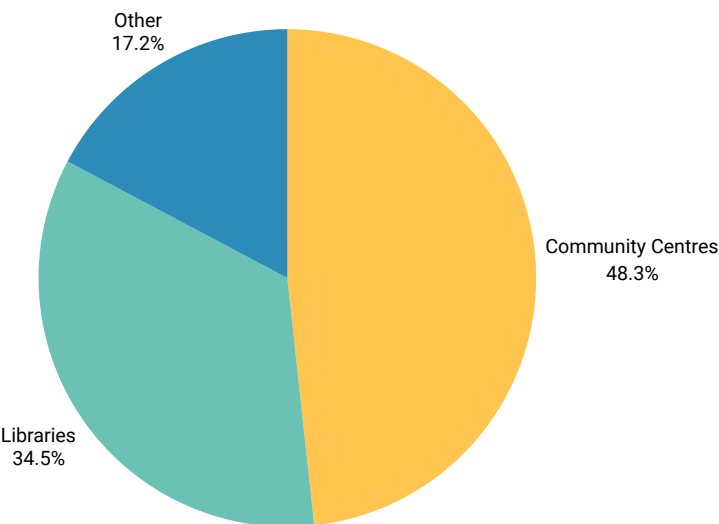

Health outcomes versus mortality: The 214 overdoses include cases where health impacts such as hypoxia or long-term damage were reduced by Brave’s faster response, even though these incidents wouldn’t have necessarily resulted in death.

Low Report Rate vs. True Overdose Rate: The 214 overdoses reported as detected by sensors in 2024 represent a dramatically lower number of overdoses detected by sensor and reversed in actuality for a variety of factors, including immediate ongoing emergency response, concern surrounding the reporting of an overdose in a facility, and uncertainty around overdose vs. other critical medical conditions.

Library Specific Statistics 2024

Community Sensor Locations 2024

Our best estimates based on feedback from current clients suggests that actual overdose detection rate by sensors is **as much as 50% higher than reported.**
